Step 1: brainstorm.

Some of the experiences that i've learned from coding was a lot of things when I first started this course I had only a little bit of experience with coding from taking devmountains coding basics class but we only learned a little bit of javascript, some of the things I learned from this class was learning how to do for loops, while loops and if/else statements. How I would figure out my bugs is I would reread my code and the main things I would look for would be any misspelling or any syntax errors since those tend to be where most of my bugs would come from.

My hardest part about this course would have to be week 2 since there was just so much that we had to learn that week and me not knowing how to code so everything that we learned that week was all new to me, for me the hardest part of that week was finding the bugs since I was getting so many because I would type the code in wrong, how I was able to debug it is I would go back and read my code back and see if I had a spelling error. From that week we learned how to create functions and for loops.

Step 2: write.

My capstone for my project I used axios and cors and I used those because I did an axios get and post request in my backend, something I learned from my project is that it was not that easy but I got to get a little bit more experience using axios get request.

One of the bugs I was having that was causing me to have a lot of issues was I had a typing error and a function inside of another functions bracket so I just had to move it out of there, for the typing error I reread my code and what it was in one of my req,res instead of having a q at the end of req I had a w.

Step 3: finalize.

For my capstone project one of the the bugs that gave me a hard time was trying to find out my bugs I had one of the bugs was I had a function inside of and another function and how I was able to fix that bug is all I had to do was move that function I had and put it on the outside of it and when I did that I was able to make my website work a lot better and do what it was supposed to do. The typing errors gave me a little trouble since there was so many words I had to go through and only see I had to fix one word and that was in my req, res, what I had misspelled was my req instead of having a q I had a w, when I was able fix that my website worked after fixing that little error.
